CURRICULUM VITAE

PING HSU

ping.hsu@sjsu.edu

EDUCATION:

University of California, Berkeley; Dept. of EECS.
Ph.D. in Electrical Eng., graduated: 12/88
Thesis title: Control of Mechanical Manipulators
Minor areas: Mechanics and Mathematics

Southern Methodist University, Dallas, Texas
M.S. in Electrical Eng., graduated: 12/79
Major area: Computer Hardware and Digital System
Minor area: Computer software.

St. John's Unversity, Taiwan (formerly, St. John's & St. Mary's Institute of Technology)
Major area: Electronics
Diploma, graduated: 6/77

EXPERIENCE:

8/13-present   San Jose State University
College of Engineering
Position: Interim Associate Dean

8/12-2/13   San Jose State University
College of Engineering
Position: Interim Dean

8/08 – 8/12   San Jose State University
Department of Electrical Engineering
Position: Professor

10/01 – 8/08   San Jose State University
College of Engineering
Position: Associate Dean

8/00 – 9/01   San Jose State University
Department of Electrical Engineering
Position: Associate Chair

8/90-7/00   San Jose State University
Department of Electrical Engineering
College of Engineering
Position: Assistant Professor ('90), Associate Professor ('93), and Professor ('00)

1/89-7/90   University of Illinois at Urbana-Champaign
Department of Mechanical and Industrial Engineering

Position: <u>Assistant Professor</u>

8/83-12/88   University of California, Berkeley
               Position: <u>Research Assistant</u>
               Research areas include general system theory, adaptive control, robotics, and dynamics.
               Position: <u>Teaching Assistant</u>
               Taught one semester control lab and four semesters instrumentation lab.

1/80-7/83   The Navtrol Company, Dallas, Texas. (214)234-3319
               Position: <u>Engineer</u>
               Developed various real time digital control system components and
               supervised the prototype construction.

1/79-1/80   Southern Methodist University, Dallas, Texas.
               Position: <u>Research Assistant</u>
               Worked in Solar Energy Research Lab. Designed and installed interface for controlling a
               X-Y positioner with a HP 9825 microcomputer.

7/79-9/79   TOCOM Cooperation, Dallas, Texas.
               Position: <u>Summer intern</u>
               Designed a local data scanner system based on a Z80 CPU to back up a minicomputer
               system for the central office of a cable TV based home security system.

8/78-12/78 Southern Methodist University, Dallas, Texas.
               Position: <u>Research Assistant</u>
               Designed and installed an interface system connecting a magnetic tape recorder with an
               EAI 640 minicomputer.

INDUSTRY PROJECTS:

Kenetech Windpower

- Developed a real-time rotor resistance identification scheme for a Field Oriented Controlled (FOC) induction generator. The objective of the study was to evaluate the potential performance improvement provided by such an identification scheme.

- Studied the dynamic interaction between a FOC based controller with the dynamics of the generator, the gear box, and the main turbine shaft.   An analytic model and a computer model of the overall system were developed. The purpose of the study was to identify potential excessive stress on the gears due to the dynamic interaction between the control algorithm and the structure dynamics of the gear box and the turbine shaft.

- Studied the transient torque produced by an induction generator during an electrical failure due to phase-to-phase or phase-to-neutral cable short or inverter component failure.

- Developed a control algorithm for inverters for unbalanced loading condition. The control scheme adaptively adjust both the positive and negative sequence components of the output current so as to keep the voltage balanced under unbalanced loading condition.

- Studied and proposed a way to detect speed measurement error (tachometer failure) by power measurement.

- Studied the relationship between the flux level and the overall power loss (including the inverter and the generator loss).

Exponent Failure Analysis

- The work involved studying failure modes of various electronics and electrical equipment.

Trace Technologies:

- Studied a high efficient grid-tied photovoltaic inverter system and proposed an optimum peak-power-tracking algorithm.

- Developed a 3-level PWM control scheme for a grid-tied inverter. This scheme substantially reduced the switching loss and the transformer core loss. This resulted in a substantial improvement of the overall system efficiency.

- Developed a control scheme including necessary analog circuitries for data acquisition for a micro-turbine driven DC brushless generator. The speed of operation of this system can reach up to 100krpm.

- Developed a Field Oriented Control (FOC) program for a wind turbine driven, grid-tied, doubly fed wound-rotor 750kW generator. This wind turbine is currently a major production model by a major energy/electic equipment company in the US. The control program is based on a DSP digital control system and it is capable of controlling both the real and the reactive output power. This work included the development of the control program, a computer model, an analytic model, and the evaluation and field testing of the system.

GE Nuclear

- Developed an experimental FOC based induction motor driven positioning system. The system is for the control of nuclear reaction control rods. The experimental system has the potential of replacing the existing stepper-motor based system. This work include the development of a fully functional system and the design and development of a custom induction motor.

- Evaluation of the stability of a voltage regulator for a variable speed induction motor. This motor is used in a recalculation system in nuclear reactors.

United Defenses

- Involvoed in the development of a field-oriented control based induction motor/generator control system for special purpose diesel-electric vehicles.

- Developed computer models for permanent magnet machines and induction machine and their control systems for the next generation diesel-electric vehicles.

BAE Systems

- Providing advices and guidelines for power electronics and their control for various special purpose hybrid vehicles..
