FAQs about the Forensic Science-Crime Scene Investigation Concentration October 2024 Version 2

How do I declare a major in FS-Crime Scene Investigation?

We're currently accepting a very limited number of applications to the Forensic Science-Crime Scene Investigation Concentration, but there are other options. So, continue reading!

I really want to work in forensic science in a crime lab. What can I do?

If you want to work in a crime lab, the CSI concentration would not have gotten you there anyway, since CSIs work in the field, not in labs. To work in a crime lab, you will need to pursue a different concentration in forensic science: FS Chemistry, FS Biology or FS Digital Evidence. These FS Concentrations are currently accepting some new students.

I actually prefer fieldwork and want to become a crime scene investigator or fingerprint examiner. What should I do?

You may want to declare FS Biology or FS Chemistry because these concentrations cover all CSI-related careers and much more (such as biotechnology and biomedical fields). Just make sure to check the respective roadmap for the desired concentration.

I want to work in criminal justice, but I find forensic science really interesting? What can I do?

You may want to pursue a minor in Forensic Studies with a major In Justice Studies or Justice Studies-Criminology concentration. You can begin courses in these areas in Spring 2025. In some instances, this would allow a career in crime scene investigation (depending on job description).

I'm really committed to FS-CSI, so I'll wait. Also, can I declare another FS concentration (let's say FS Bio) and switch to CSI later?

The FS-CSI program is impacted. We don't when, or how many, students we will be able to accept, so we can't guarantee a place in the foreseeable future.

Is there someone I could talk with about what courses I should take next semester?
